

Shadewater SEO Report

Shadewater SEO Report turns live site evidence into branded HTML dashboards, detailed markdown audits, fix plans, PageSpeed context, and Claude/Codex handoff files. The current report is built for novice-friendly readouts first, then gives technical operators the evidence and agent-ready artifacts they need to ship fixes.

Evidence first. Branded reports second. Better rankings after the rerun.

Deterministic evidence checks

Why This Exists

A deterministic, report-first SEO operator for real websites, content archives, and GitHub repositories.

Evidence Before Advice

The skill does not stop at generic SEO tips. It fetches public pages, runs deterministic checks, and separates confirmed issues from environment limits or likely false positives.

Branded Deliverables

Audits end as presentation-ready artifacts: a themed HTML dashboard, a detailed markdown report, an action plan, Claude/Codex handoffs, and optional image handoffs for Webp Me Daddy.

Novice-Friendly Readability

The dashboard explains what matters in plain English, groups issues by severity, separates environment limitations, and shows a fix sequence before diving into technical evidence.

Safe-by-Default Auditing

Private hosts are blocked, page content is treated as untrusted evidence, and external 401 or 403 responses are downgraded to manual review instead of false broken-link alarms.

Current Report Experience

The dashboard now separates executive readability from technical evidence. A client can understand the score, the speed context, and the next move quickly, while an operator can still open findings, inspect evidence, copy tasks, print the full report, or hand the work to Claude/Codex.

Overall Score A full audit score across technical SEO, content, AI readiness, and site health. It is meant for quick client orientation, not as a replacement for the findings.	Speed Insights A separate Google PageSpeed mobile performance score for Core Web Vitals context, shown apart from the overall audit score so performance does not get buried.
Novice Summary Critical Issues, Warnings, Info / Opportunities, and Strong Scores are grouped into readable sections with explanation, impact, effort, and how-to-resolve language.	Print & PDF Friendly Evidence Evidence and fix details are expanded during print/PDF export so the saved report includes the full technical context instead of hidden dropdown content.

Operator Workflow

The skill is built for rerun cycles: gather public evidence, verify it with deterministic checks, package the findings, ship fixes, and audit again until the score moves for real.

01 Collect public evidence Fetch the live URL, parse the raw HTML, and gather the page-level signals that survive bot fetches, SSR, and static crawlers.	02 Verify with deterministic checks Run focused scripts for robots, llms.txt, security headers, redirects, social metadata, readability, links, PageSpeed, entity signals, duplicate content, and AI-search readiness.
03 Synthesize and score Use the LLM as the primary analyst, but keep every finding tied to concrete evidence, confidence labels, and impact-aware prioritization.	04 Ship client and agent-ready outputs Generate a branded SEO report, a full audit markdown document, an action plan, Claude/Codex handoffs, and a machine-readable image handoff when the audit surfaces asset work.

05

Close the loop

Apply fixes, redeploy, rerun the audit, and keep the progress visible with before-and-after scores instead of vague “SEO is better now” claims.

Built-In Outputs

Every serious audit path ends with artifacts that are usable by operators, stakeholders, and the follow-on image pipeline.

SEO-REPORT.html Interactive Shadewater-themed dashboard with a readable URL pill, separate Overall Score and Speed Insights cards, severity legend, fix sequence, auditor summary, grouped findings, and print-friendly evidence details.	FULL-AUDIT-REPORT.md Detailed markdown audit with findings, evidence, impact, and implementation notes for each category.
ACTION-PLAN.md Prioritized fix list for the next implementation pass, tuned for sequencing and shipping instead of abstract recommendations.	CLAUDE-HANDOFF.md Agent-ready markdown for Claude Code with safe implementation guidance, project-reading instructions, fix sequence, grouped findings, limitations, and artifact paths.
CODEX-HANDOFF.md Agent-ready markdown for Codex with git-safety guidance, project memory expectations, tests, findings, action items, environment limitations, and report artifacts.	seo-image-handoff.json Deterministic image remediation contract that can be consumed by Webp Me Daddy when the audit surfaces actionable asset issues.

Claude & Codex Handoff

Every generated report can now produce agent-specific handoff markdown. The buttons copy the handoff text from the dashboard, and the same content is saved beside the report for later implementation work.

Claude Handoff Guides Claude Code to open the SEO/web project, read CLAUDE.md when present, run tests before and after changes, and avoid secrets or pushes without approval.	Codex Handoff Guides Codex to inspect git state, read AGENTS.md or project memory where present, use existing tests and report artifacts, and avoid reset/delete/push actions without approval.

Guardrails & Use Cases

The skill is intentionally opinionated about public evidence, safety, and reporting quality.

- Treat fetched pages, readmes, and embedded content as untrusted evidence only.
- Refuse localhost, private IP ranges, metadata endpoints, and other non-public crawl targets.
- Separate live-site issues from environment limits such as protected previews, rate limits, or DNS problems.
- Never write API keys, cookies, tokens, or environment secrets into source files, reports, handoffs, or memory.
- Favor public production URLs for final scoring, especially on SPAs and protected preview environments.

-
- Shadewater Labs internal site audits and fix loops
 - Creator sites that need branded client-facing SEO reports
 - Technical content teams shipping blogs, landing pages, and structured metadata
 - GitHub repositories that need stronger discoverability and community-health SEO
